RESEARCH INTERESTS

Multi-modal Models; Embodied AI.

- My research focuses on multimodal world modeling and embodied AI, with an emphasis on multi-modal models for egocentric spatial reasoning, navigation, and robot action planning. I am interested in building scalable learning systems that bridge perception, planning, and physical interaction, enabling generalist humanoid agents to operate robustly in real-world environments.

Beijing Academy of Artificial Intelligence, Beijing, China 2024.10 - 2025.06

Research Intern supervised by ***Dr. Börje F. Karlsson***.

- Internship at the Multimodal Interaction Research Group.
- Explore the real-world application of large language models, focusing on the direction of Multi-modal Embodied AI. By introducing large-scale language models, we aim to provide different forms of robots with capabilities such as reasoning, planning, memory, and generalization.

Mila & McGill University , Montréal, Canada 2023.07 - 2024.06

Joint Ph.D. Student supervised by ***Prof. Jackie Chi Kit Cheung***.

- Investigating the working mechanism of large language models (LLMs) when they achieve in-context learning, we find that the information valuable for conducting the final task is aggregated by LLMs into the representations of a few specific tokens, which we call **task-encoding tokens**.
- We further extend this insight to the more general language modeling scenario and apply it to a useful application: long sequence modeling. By iteratively removing unnecessary key-value states, we manage to enable the language model to process and generate sequences with up to 1 million tokens without any further training. A novel **instruction-aware state eviction** method is also proposed to help the model focus on information related to the final task.

Language Technology Lab, Alibaba DAMO Academy, Beijing, China 2021.10 - 2022.04

Research Intern supervised by ***Dr. Kai Fan*** *and* ***Dr. Boxing Chen***.

- Explore the task of Cross-Lingual Summarization (CLS), investigate the topic of cross-lingual summarization with compression rate, which unifies the Machine Translation (MT) and the CLS task with "compression rate".

- Explore the task of low-resource text summarization, leveraging structured prefix to improve performance of few-shot summarization.
- Improve the efficiency of summarization task by designing Adaptive Computing Time (ACT) for summarization and a semi-autogressive decoder which generates all the summary sentences simultaneously.
